The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

09/673,532

Applicant(s)

KONDO ET AL.

Examiner

HELEN SHIBRU

Art Unit

2621

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 17 April 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 3-10, 12-18, 20-27, 37-42, 49-57 and 64-75 is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

- 5) ☐ Claim(s) _____ is/are allowed.

- 6) ☒ Claim(s) 1, 3-10, 12-18, 20-27, 37-42, 49-57, and 64-75 is/are rejected.

- 7) ☐ Claim(s) _____ is/are objected to.

- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)

Detailed Action

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(c), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(c) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 04/17/2008 has been entered.

Response to Arguments

2. Applicant's arguments with respect to claims have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later

invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 1, 3-5, 7, 10, 12-14, 16, 49, and 50-54 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No. 5,436,659) and further in view of Dischert (US Pat. No. 4,499,494) Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat .No. 6, 400, 890) and Nomura et al (US PG PUB 2002/0101168).

Regarding claim 1, Takahashi et al discloses an image-signal processing apparatus (Fig. 1) for processing an input image signal at a position of each pixel, said input image signal having any one of various color components, said apparatus comprising:

extraction means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for extracting a plurality of pixels located near each pixel of interest of the image signal;

class-determining means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for determining a class from the pixels extracted by the extraction means; and

pixel-generating means (predicting circuit 5 of Fig. 1, col. 3, lines 33-42) for generating a pixel at a position of the pixel of interest in accordance with the class determined by the class-determining means, said pixel having a color component different from at least the color component of the pixel of interest,

wherein the plurality of pixels extracted by the extraction means and used by the class determining means includes at least one pixel that is not adjacent to the pixel of interest (col. 3, lines 44-60 and col. 4, lines 50-63).

Claim 1 differs from Takahashi in that the claim further requires defect-correcting means for correcting defective pixels in the input image signal.

In the same field of endeavor Vincent discloses a digital imaging system (see col. 4 lines 52-64 and fig. 1). Vincent teaches defect correction block which identifies the location of defective pixels in the image so they can be corrected (see col. 8 lines 30-58). Therefore in light of the teaching in Vincent it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Takahashi by providing defect correcting means in order to correct defective images.

Claim 1 further differs from the proposed combination of Takahashi and Vincent in that the claim further requires clamping means for clamping the input image signal to eliminate shifted components of the defect-corrected image signal.

In the same field of endeavor Dischert discloses correcting non-linearity of signals. Dischert teaches it is common to clamp video signal (see col. 1 lines 9-32). Dischert further discloses the gamma corrector reduces or eliminates the perturbation of the signal by reducing or eliminating noise near the black level (see fig. 2 and col. 2 line 62-col. 3 line 11). Dischert further discloses clamping means is coupled to source of synchronizing signals, source of television signals, and source of reference voltage source for clamping particular signal amplitude thereby producing a clamped television signal (see claim 1). Therefore in light of the teaching in Dischert, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the proposed combination of Takahashi and Vincent by including clamping means in order to reduce the noise level.

Claim 1 further differs from Takahashi, Vincent, and Dischert in that the claim further requires white-balancing means for white-balancing the input image signal to correct the gain of the clamped image signal supplied from the clamping means.

In the same field of endeavor Miyake discloses an analog image processing circuit 42 in fig. 1 white balances and gamma-corrects the input image signal (see col. 6 line 61-col. 7 line 5). Therefore in light of the teaching in Miyake it would have been obvious to one of ordinary skill in the art at the time the invention was made to white-balance image signals in order to adjust the image.

Claim 1 further differs from the above proposed combination in that the claim further requires pixel having all color components.

In the same field of endeavor Nagasaka discloses pixels having all color components (see col. 9 lines 33-57). Nagasaka further discloses self organization of video to be classified and arranged on the basis of the identity of partial images of video (see abstract). Therefore in light of the teaching in Nagasaka it would have been obvious to one of ordinary skill in the art at the time the invention was made to generate a pixel with all color components in order to improve resolution of the image.

Claim 1 differs from the above proposed combination in that the claim further requires extracting a plurality of pixels in accordance with the color component of the plurality of pixels to be extracted.

In the same field of endeavor Nomura discloses extracting a plurality of pixels in accordance with the color component of the plurality of pixels to be extracted (see paragraphs 0257-0258). Therefore in light of the teaching in Nomura it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the above proposed combination by extracting a plurality of pixels in accordance with the color component in order to produce sharp image.

Regarding claim 3, Takahashi et al discloses the the pixel-generating means comprises storage means for storing a set of prediction coefficients for each class and operation means for performing an operation on a set of prediction coefficients which corresponds to the class determined by the class-determining means and the pixels located near the pixel of interest which have been extracted by the extraction means, thereby to generate a pixel having a color component different from at least the color component of the pixel of interest (coefficient memory 4 of Fig. 1, col. 4, line 64 to col. 5, line 40).

Regarding claim 4, Takahashi et al discloses the operation means performs an operation on a linear combination of the set of prediction coefficients and the values of the pixels located near the pixel of interest (col. 5, line 60 to col. 6, line 58).

Regarding claim 5, Takahashi et al discloses the extraction means extracts at least one different pixel and supplies the same to the class-determining means and the operation means (block segmenting circuit 2 and class code circuit 3 of Fig. 1, col. 3, lines 15-43).

Regarding claim 7, Takahashi et al discloses acquisition means for acquiring an image signal having a pixel at each pixel position, said pixel having one of various color components (Fig. 2, col. 3, lines 44-60).

Method claims 10, 12-14 and 16 are rejected for the same reasons as discussed in apparatus claims 1, 3-5 and 7 above.

Regarding claim 49, Takahashi et al discloses an image-signal processing apparatus (Fig. 1) for processing an input image signal at a position of each pixel, said input image signal having any one of various color components, said apparatus comprising:

extraction means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for extracting a plurality of pixels located near each pixel of interest of the input image signal, each pixel having a color component of the highest density of all color components;

class-determining means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for determining a class from the pixels extracted by the extraction means; and

pixel-generating means (predicting circuit 5 of Fig. 1, col. 2, lines 32-44 and col. 3, lines 33-42) for generating a pixel at a position of the pixel of interest in accordance with the class determined by the class-determining means, said pixel having a color component different from at least the color component of the pixel of interest,

wherein the plurality of pixels extracted by the extraction means and used by the class determining means includes at least one pixel that is not adjacent to the pixel of interest (col. 3, lines 44-60 and col. 4, lines 50-63).

Claim 49 differs from Takahashi in that the claim further requires defect-correcting means for correcting defective pixels in the input image signal.

In the same field of endeavor Vincent discloses a digital imaging system (see col. 4 lines 52-64 and fig. 1). Vincent teaches defect correction block which identifies the location of defective pixels in the image so they can be corrected (see col. 8 lines 30-58). Therefore in light of the teaching in Vincent it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Takahashi by providing defect correcting means in order to correct defective images.

Claim 49 further differs from the proposed combination of Takahashi and Vincent in that the claim further requires clamping means for clamping the input image signal to eliminate shifted components of the defect-corrected image signal.

In the same field of endeavor Dischert discloses correcting non-linearity of signals. Dischert teaches it is common to clamp video signal (see col. 1 lines 9-32). Dischert further discloses the gamma corrector reduces or eliminates the perturbation of the signal by reducing or eliminating noise near the black level (see fig. 2 and col. 2 line 62-col. 3 line 11). Dischert further discloses clamping means is coupled to source of synchronizing signals, source of television signals, and source of reference voltage source for clamping particular signal amplitude thereby producing a clamped television signal (see claim 1). Therefore in light of the teaching in Dischert, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the proposed combination of Takahashi and Vincent by including clamping means in order to reduce the noise level.

Claim 49 further differs from Takahashi, Vincent, and Dischert in that the claim further requires white-balancing means for white-balancing the input image signal to correct the gain of the clamped image signal supplied from the clamping means.

In the same field of endeavor Miyake discloses an analog image processing circuit 42 in fig. 1 white balances and gamma-corrects the input image signal (see col. 6 line 61-col. 7 line 5). Therefore in light of the teaching in Miyake it would have been obvious to one of ordinary skill in the art at the time the invention was made to white-balance image signals in order to adjust the image.

Claim 49 further differs from the above proposed combination in that the claim further requires pixel having all color components.

In the same field of endeavor Nagasaka discloses pixels having all color components (see col. 9 lines 33-57). Nagasaka further discloses self organization of video to be classified and arranged on the basis of the identity of partial images of video (see abstract). Therefore in light of the teaching in Nagasaka it would have been obvious to one of ordinary skill in the art at the time the invention was made to generate a pixel with all color components in order to improve resolution of the image.

Claim 49 differs from the above proposed combination in that the claim further requires extracting a plurality of pixels in accordance with the color component of the plurality of pixels to be extracted.

In the same field of endeavor Nomura discloses extracting a plurality of pixels in accordance with the color component of the plurality of pixels to be extracted (see paragraphs 0257-0258). Therefore in light of the teaching in Nomura it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the above proposed combination by extracting a plurality of pixels in accordance with the color component in order to produce sharp image.

Regarding claim 50, Takahashi et al discloses the pixel-generating means comprises storage means for storing a set of prediction coefficients for each class and operation means for performing an operation on a set of prediction coefficients which corresponds to the class determined by the class-determining means and the pixels located near the pixel of interest which

have been extracted by the extraction means, thereby to generate a pixel having the different color component (coefficient memory 4 of Fig. 1, col. 4, line 64 to col. 5, line 40).

Regarding claim 51, Takahashi et al discloses the pixel-generating means generates a pixel having all color components at the position of the pixel of interest (col. 4, lines 50-63).

Method claims 52-54 are rejected for the same reasons as discussed in apparatus claims.

6. Claims 64-71 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No. 5,436,659) and further in view of Dischert (US Pat. No. 4,499,494) Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat. No. 6,400,890)

Regarding claim 64, Takahashi et al discloses an image-signal processing apparatus (Fig. 1) for processing an input image signal at a position of each pixel, said input image signal having any one of various color components, said apparatus comprising:

extraction means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for extracting a plurality of pixels located near each pixel of interest of the input image signal;

class-determining means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) including a characteristic-data generating section for generating characteristic data about the pixels of each color component, from the pixels of each color component which have been extracted by the extraction means, and a class-determining section for determining a class from the characteristic data generated for each color component; and

pixel-generating means (predicting circuit 5 of Fig. 1, col. 2, lines 32-44 and col. 3, lines 33-42) for generating a pixel in accordance with the class determined by the class-determining

means, said pixel having a color component different from at least the color component of the pixel of interest,

wherein the plurality of pixels extracted by the extraction means and used by the class determining means includes at least one pixel that is not adjacent to the pixel of interest (col. 3, lines 44-60 and col. 4, lines 50-63).

Claim 64 differs from Takahashi in that the claim further requires defect-correcting means for correcting defective pixels in the input image signal.

In the same field of endeavor Vincent discloses a digital imaging system (see col. 4 lines 52-64 and fig. 1). Vincent teaches defect correction block which identifies the location of defective pixels in the image so they can be corrected (see col. 8 lines 30-58). Therefore in light of the teaching in Vincent it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Takahashi by providing defect correcting means in order to correct defective images.

Claim 64 further differs from the proposed combination of Takahashi and Vincent in that the claim further requires clamping means for clamping the input image signal to eliminate shifted components of the defect-corrected image signal.

In the same field of endeavor Dischert discloses correcting non-linearity of signals. Dischert teaches it is common to clamp video signal (see col. 1 lines 9-32). Dischert further discloses the gamma corrector reduces or eliminates the perturbation of the signal by reducing or eliminating noise near the black level (see fig. 2 and col. 2 line 62-col. 3 line 11). Dischert further discloses clamping means is coupled to source of synchronizing signals, source of television signals, and source of reference voltage source for clamping particular signal

amplitude thereby producing a clamped television signal (see claim 1). Therefore in light of the teaching in Dischert, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the proposed combination of Takahashi and Vincent by including clamping means in order to reduce the noise level.

Claim 64 further differs from Takahashi, Vincent, and Dischert in that the claim further requires white-balancing means for white-balancing the input image signal to correct the gain of the clamped image signal supplied from the clamping means.

In the same field of endeavor Miyake discloses an analog image processing circuit 42 in fig. 1 white balances and gamma-corrects the input image signal (see col. 6 line 61-col. 7 line 5). Therefore in light of the teaching in Miyake it would have been obvious to one of ordinary skill in the art at the time the invention was made to white-balance image signals in order to adjust the image.

Claim 64 further differs from the above proposed combination in that the claim further requires pixel having all color components.

In the same field of endeavor Nagasaka discloses pixels having all color components (see col. 9 lines 33-57). Nagasaka further discloses self organization of video to be classified and arranged on the basis of the identity of partial images of video (see abstract). Therefore in light of the teaching in Nagasaka it would have been obvious to one of ordinary skill in the art at the time the invention was made to generate a pixel with all color components in order to improve resolution of the image.

Regarding claim 65, Takahashi et al discloses the characteristic-data generating section generates, as the characteristic data, a space activity of the pixels of each color component,

which have been extracted by the extraction means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10).

Regarding claim 66, Takahashi et al discloses the characteristic-data generating section generates the space activity by performing of ADRC (Adaptive Dynamic Range Coding) process on the pixels of each color component (col. 1, lines 39-50).

Regarding claim 67, Takahashi et al discloses the extraction means extracts the pixels corresponding to each color component from pixels existing in a region near the pixel of interest (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10).

Method claims 68-71 are rejected for the same reasons as discussed in apparatus claims 64-67 above.

7. Claims 37-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No. 5,436,659) and further in view of Dischert (US Pat. No. 4,499,494) Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat .No. 6, 400, 890) and further in view of Fujiwara (US Pat. No. 6,614,846).

Regarding claim 37, Takahashi et al discloses an image-signal processing apparatus for processing an input image signal, said input image signal having a prescribed number of sample values which constitute one image and each of which represents any one of various colors at each pixel, said apparatus comprising:

extraction means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for extracting a plurality of pixels located near each pixel of interest of the input image signal;

class-determining means (class code circuit 3 of Fig. 1, col. 3, lines 44 to col. 4, line 10) for determining a class from the pixels extracted by the extraction means; and

output image-signal generating means (predicting circuit 5 of Fig. 1, col. 2, lines 32-44 and col. 3, lines 33-42) for generating an output image signal having more sample values than the prescribed number, for the various colors, by processing each pixel of the input image signal in accordance with the class determined by the class-determining means,

wherein the plurality of pixels extracted by the extraction means and used by the class determining means includes at least one pixel that is not adjacent to the pixel of interest (col. 3, lines 44-60 and col. 4, lines 50-63).

Claim 37 differs from Takahashi in that the claim further requires defect-correcting means for correcting defective pixels in the input image signal.

In the same field of endeavor Vincent discloses a digital imaging system (see col. 4 lines 52-64 and fig. 1). Vincent teaches defect correction block which identifies the location of defective pixels in the image so they can be corrected (see col. 8 lines 30-58). Therefore in light of the teaching in Vincent it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Takahashi by providing defect correcting means in order to correct defective images.

Claim 37 further differs from the proposed combination of Takahashi and Vincent in that the claim further requires clamping means for clamping the input image signal to eliminate shifted components of the defect-corrected image signal.

In the same field of endeavor Dischert discloses correcting non-linearity of signals. Dischert teaches it is common to clamp video signal (see col. 1 lines 9-32). Dischert further

discloses the gamma corrector reduces or eliminates the perturbation of the signal by reducing or eliminating noise near the black level (see fig. 2 and col. 2 line 62-col. 3 line 11). Dischert further discloses clamping means is coupled to source of synchronizing signals, source of television signals, and source of reference voltage source for clamping particular signal amplitude thereby producing a clamped television signal (see claim 1). Therefore in light of the teaching in Dischert, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the proposed combination of Takahashi and Vincent by including clamping means in order to reduce the noise level.

Claim 37 further differs from Takahashi, Vincent, and Dischert in that the claim further requires white-balancing means for white-balancing the input image signal to correct the gain of the clamped image signal supplied from the clamping means.

In the same field of endeavor Miyake discloses an analog image processing circuit 42 in fig. 1 white balances and gamma-corrects the input image signal (see col. 6 line 61-col. 7 line 5). Therefore in light of the teaching in Miyake it would have been obvious to one of ordinary skill in the art at the time the invention was made to white-balance image signals in order to adjust the image.

Claim 37 further differs from the above proposed combination in that the claim further requires pixel having all color components.

In the same field of endeavor Nagasaka discloses pixels having all color components (see col. 9 lines 33-57). Nagasaka further discloses self organization of video to be classified and arranged on the basis of the identity of partial images of video (see abstract). Therefore in light of the teaching in Nagasaka it would have been obvious to one of ordinary skill in the art at the

time the invention was made to generate a pixel with all color components in order to improve resolution of the image.

Claim 37 further differs from the above proposed combination in that the claim further requires generating an output image signal in accordance with a relative position of added samples to a corresponding sample in the input image signal.

In the same field of endeavor Fujiwara discloses generating an output image signal in accordance with a relative position of added samples to a corresponding sample in the input image signal (see col. 7 lines 43-61). Therefore in light of the teaching in Fujiwara it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the above proposed combination by generating an output image signal in accordance with a relative position in order to improve the accuracy of motion vectors.

Regarding claim 38, Takahashi et al discloses the claimed characterized in that the output image-signal generating means comprises storage means for storing a set of prediction coefficients for each class and operation means for performing an operation on a set of prediction coefficients which corresponds to the class determined by the class-determining means and the pixels located near the pixel of interest which have been extracted by the extraction means, thereby to generate the output image signal (coefficient memory 4 of Fig. 1, col. 4, line 64 to col. 5, line 40).

Method claims 39-40 are rejected for the same reasons as discussed in apparatus claims 37-38 above.

8. Claims 19, 21-23, 25, 55, and 56-57 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No.

5,436,659) and further in view of Dischert (US Pat. No. 4,499,494), Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat. No. 6,400,890), and further in view of Official Notice and Fujiwara (US Pat. No. 6,614,846).

Regarding claim 19, Takahashi as further modified by Vincent, Dischert, Miyake Fujiwara and Nagasaka discloses all the claimed limitations as discussed in claim 1 above except for providing a recording medium storing a computer program.

It is noted that using microprocessor with ROM for processing video signal is old and well known in the art and; therefore, Official Notice is taken.

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the well known microprocessor and ROM into Takahashi et al's system in order to simplify and accurately process the video signal.

Claims 21-23 and 25 are rejected for the same reasons as discussed in claims 3-5 and 7 above.

Regarding claim 55, Takahashi as further modified by Vincent, Dischert, Miyake Fujiwara and Nagasaka discloses all the claimed limitations as discussed in claim 52 above except for providing a recording medium storing a computer program.

It is noted that using microprocessor with ROM for processing video signal is old and well known in the art and; therefore, Official Notice is taken.

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the well known microprocessor and ROM into Takahashi et al's system in order to simplify and accurately process the video signal.

Claims 56-57 are rejected for the same reasons as discussed in claims 53-54 above.

9. Claims 41 and 42 are rejected under 35 U.S.C. 103(a) as being unpatentable over as rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No. 5,436,659) and further in view of Dischert (US Pat. No. 4,499,494) Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat .No. 6, 400, 890) and further in view of Fujiwara (US Pat. No. 6,614,846) and Official Notice.

Regarding claim 41, Takahashi as further modified by Vincent, Dischert, Miyake Fujiwara and Nagasaka discloses all the claimed limitations as discussed in claim 39 above except for providing a recording medium storing a computer program.

It is noted that using microprocessor with ROM for processing video signal is old and well known in the art and; therefore, Official Notice is taken.

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the well known microprocessor and ROM into Takahashi et al's system in order to simplify and accurately process the video signal.

Claim 42 is rejected for the same reasons as discussed in claim 40 above.

10. Claims 72 and 73-75 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No. 5,436,659) and further in view of Dischert (US Pat. No. 4,499,494) Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat .No. 6, 400, 890) and further in view of Official Notice.

Regarding claim 72, Takahashi as further modified by Vincent, Dischert, Miyake Fujiwara and Nagasaka discloses all the claimed limitations as discussed in claim 64 above except for providing a recording medium storing a computer program.

It is noted that using microprocessor with ROM for processing video signal is old and well known in the art and; therefore, Official Notice is taken.

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the well known microprocessor and ROM into Takahashi et al's system in order to simplify and accurately process the video signal.

Claims 73-75 are rejected for the same reasons as discussed in claims 65-67 above.

11. Claims 6, 8, 9, 15, 17-18, 24, and 26-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al (US 5,469,216) in view of Vincent et al. (US Pat. No. 5,436,659) and further in view of Dischert (US Pat. No. 4,499,494), Miyake (US Pat. No. 6,222,985), Nagasaka (US Pat. No. 6,400,890), Nomura et al (US PG PUB 2002/0101168). and further in view of Kndo et al (US 5,748,235).

Regarding claim 6, Takahashi as further modified by Vincent, Dischert, Miyake and Nagasaka discloses all the claimed limitations as discussed in claim 1 above except for providing the color component represent a color of red, blue, or green.

Kondo et al teaches that the capability of converting standard definition to high definition can be applied to color image generated from CCD (col. 4, lines 30-44).

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the generating of color image generated from CCD as taught by Kondo et al into Takahashi et al's system in order to convert color image to high definition.

Regarding claim 8, Kondo et al discloses the acquisition means is a solid-state imaging element (col. 4, lines 30-44).

Regarding claim 9, the proposed combination of Takahashi, Vincent, and Kondo disclose all the claimed limitations except for providing the solid-state imaging element is a CCD image sensor of the Bayer arrangement.

It is noted that the CCD image sensor of the Bayer arrangement is old and well known in the art and; therefore, Official Notice is taken.

It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the well known CCD image sensor of the Bayer arrangement into Kondo et al's system since it merely amounts to selecting readily available CCD.

Claims 15 and 17-18 are rejected for the same reasons as discussed in claims 6 and 8-9 above.

Claims 24 and 26-27 are rejected for the same reasons as discussed in claims 6 and 8-9 above.

Conclusion

12. Any inquiry concerning this communication or earlier communications from the examiner should be directed to HELEN SHIBRU whose telephone number is (571)272-7329. The examiner can normally be reached on M-F, 8:30AM-5PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, THAI Q. TRAN can be reached on (571) 272-7382. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
